**DETAILED ACTION**

***Response to Amendment***

1. Applicant's arguments with respect to claims 18-19 and 26-27 have been considered but are moot in view of the new ground(s) of rejection.

***Claim Rejections - 35 USC § 102***

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 18-19 and 26-27, are rejected under 35 U.S.C. 102(e) as being anticipated by Monte et al. (US Patent 6,023,606).

Regarding claim 18, Monte et al. disclose detecting the content of said monitored data, wherein the demand for capacity is predicted according to said content (see col.1 lines 51-64).

Regarding claim 19, Monte et al. disclose a method of allocating frequency channels to a plurality of wireless transceivers, comprising:

transmitting to each of said transceivers a forward frequency channel allocation signal indicating an allocation of one or more forward frequency channels which that transceiver is to receive (see col.8 line 65 through col.9 line 5); and

transmitting to each of said transceivers, in at least one said forward frequency channels assigned to that transceiver, a respective return channel allocation signal indicating an

allocation of one or more return frequency channels in which that transceiver may transmit (see col.4 lines 5-14);

wherein, for each forward frequency channel, a set of preferred return frequency channels is stored, such that for each of said transceivers to which a specified one of said forward frequency channels is allocated (see col.11 line 60 through col.12 line 11), the allocated one or more return frequency channels is preferentially selected from said corresponding set of preferred return frequency channels (see col.4 lines 5-13).

Regarding claim 26, Monte et al. disclose a method of controlling transmission by a wireless transceiver in a channel shared with transmission by other transceivers (see col.11 lines 11-12), comprising:

monitoring data transmitted to said transceiver (see col.6 lines 54-55);

predicting, on the basis of said monitoring step, a demand for capacity in said channel by said transceiver (see col.1 line 64 through col.2 line 5), and

transmitting to said transceiver an allocation signal indicating an allocation in said channel determined according to said predicted demand (see col.2 lines 1-5).

Regarding claim 27, Monte et al. disclose including generating a statistical model based on previous traffic flow to and from wireless transceivers, wherein the demand for capacity is predicted according to said statistical model (see col.11 lines 61-65).

***Allowable Subject Matter***

4. Claims 13-14, are allowed.
5. The following is a statement of reasons for the indication of allowable subject matter:

Art Unit: 2618

Regarding independent claim 13, the prior arts fail to disclose "wherein said repeat parameter indicates a range and includes an increment by which said range is increased after each repetition of step a and b", as cited in the claim.
